

annotate_child

The **annotate_child** message is sent to rename a leaf or folder in a tree. This message requires the user to pass a string that represents the new name for the leaf or the folder.

Annotate a Node in the Tree

To annotate a node in the tree, the sequence of events is as follows:

1. The client provides a new tooltip for a given leaf or folder.
2. WORK server performs the following steps:
 - a. Parses the leaf or folder index to obtain the key / table_cd
 - b. Query WORKPLACE_ACCESS table for the table name associated with the table_cd.
 - c. Update the WORKPLACE table with the new name for the leaf or folder.

1. Client annotates the leaf or folder with the new tooltip.

annotate_child Request Message

This message requires the user to pass a string that represents the new tooltip for the leaf or folder. No additional attribute settings are necessary.

```
<message_body>  
<work:annotate_child>  
<node>\\asthma\55 </node>  
<tooltip>Juvenile Asthma Set 1</tooltip>  
</work:annotate_child>  
</message_body>
```

annotate_child Response Message

A **status type** of *DONE* or *ERROR* is specified in the response header. No specialized message_body is returned to the client.
