User Viewing Their Workplace

The functionality for when a user views their workplace is described in this section.

User Logs Into i2b2

- The PM returns the roles for a given project
- Role = USER
- Query **WORKPLACE_ACCESS** table by *USER_ID*
- A list of all workplaces owned by that USER for the project they are logged into is returned. This list contains *TableCd*, *TableName* (demo, WORKPLACE, etc.)

Returning Root Level Folders For The User And Project

- A key (*tableCd*) from home workplace table will prepend the node's index string so that subsequent calls can be sent to the appropriate workplace table.

Double Click Root Level Folder

- Query **WORKPLACE_ACCESS** to perform key to table name translation
- Query returns **WORKPLACE_TABLE_NAME** to get children of that root node.
- A key from home workplace table will prepend the child node's index string so that subsequent calls can be set to the appropriate workplace table.

Drag A Leaf

- Extract **WORK_XML** contents (DnD xml) and drag to appropriate drop site.
