13.4.3.3 Patient in Project Property

Step 6: Check Patient in Project

When a *get* request is sent to the IM cell it has the capability to verify whether or not a patient is part of the project requesting the patient data. By default the property is set to *true*, if you do not wish to check the project then you can set it to *false*.

Note

In addition to setting this property to true, the IM_PROJECT_PATIENTS table has to be populated with the appropriate data in order to check if the patient is in a project. For more information on this table please see the IM Design Document.

- 1. In the im.properties file scroll to the section called Patient in Project.
- 2. Edit the im.checkPatientInProject to either true or false.

EMPI Service

im.checkPatientInProject=true

3. Save your changes but do not close the file. You will be continuing to edit the file in the next section.
