CRC Test Plug-in

The **CRC Test Plug-in** is an optional plug-in designed to work with the i2b2 Workbench. It was created so i2b2 users can test the CRC web services by running test cases that are pre-defined by the user. These test cases are simply an XML file that contains the information necessary to query the CRC Cell. A view called the Run Query view has been created to assist users in the loading of the test cases and reviewing the test results.

The following is available for download.

1. The source code for the CRC Test Plug-in
2. The jar file that can be added to an existing i2b2 Workbench

In addition to the above files a set of sample XML files have also been included with the downloads.
