# **NCBO Extraction Tool version 2.0**

#### **Extraction Tool 2.0**

The i2b2 Hive software is composed of core modules called 'cells' that create a system to allow the use of patient data for research. These cells communicate through web services and use i2b2 standard XML messages to transfer ontology-related metadata. To date, a subset of ICD-9 has been provided with the i2b2 demo software package. There has been a need in the community for access to a complete ICD-9 ontology as well as other clinical-based ontologies.

NCBO hosts a repository of biomedical ontologies. These ontologies are stored in formats that are not understood by i2b2. A tool has been developed to not only extract these ontologies via bioportal REST services, but to transform them into a format that is understood by the i2b2 ONT cell. This version of the Extraction tool was updated to work with the NCBO BioPortal v4.0 REST services API

### **New Features**

This version of the Extraction tool was updated to work with the NCBO BioPortal v4.0 REST services API

### **Tutorials**

NCBO\_Extraction\_Overview Step by step example of how metadata trees are created and configured using the NCBO Extraction tool.
