OVERVIEW -

The Workplace Framework cell (WORK) is an i2b2 Hive core cell. This cell manages i2b2 project specific XML data objects for user of a given project. The project specific XML data objects originate in other views or cells, such as Ontology or Previous Query and are stored in the WORK cell as a convenience. The project specific XML data objects in the WORK cell are organized in hierarchical structures that represent the relationships between elements. The top levels in the hierarchy are called the "***parents***" or "***roots***" with the lower levels being their "***children***". Elements occurring on the same level are known as "***siblings***". A level in a hierarchy is sometimes referred to as a "***node***".
The WORK cell does the following:

1. Accepts new XML data object for storage
2. Provides a listing of those items previously stored.
3. Allows the user to organize, label and annotate stored data objects however they choose.
